TSWG Layer 1 Spec TF

per TSWG meeting on 21SEP2020, TASK:

Establish Task Force for a Layer 1 Spec Deliverable

- [ ] Members: Drummond Reed Darrell O'Donnell Kevin Griffin Phil Feairheller
- [ ] Due Date: 30-Sep-20

Task Force Charter - a basic what's in/out for scope:

Technical Interoperability definition for the interactions between Layer 2 and Layer 1

Focus should be on:

- REQUIRED
    - CRUD for:
        - DID - Anchoring DIDs with key rotation (includes possible KERI support)
        - DID Document
        - anything else?
        - Sovrin/Indy:
            - CredDefs
            - SchemaDefs
            - what else?
    - Reference to Governance Framework that explains:
        - Adherence to main ToIP Principles <NEED LINK>
        - <TODO: flesh out various principles>
- OPTIONAL(Limited list of OTHER items):
    - DID Document serving (CRUD)
    - do we need anything as granular as getNodes() / getConsensusStatus() / getObservers()...
    - How should the Layer 1/2 spec tie in with Layer 1 governance frameworks (coordinate with GSWG)

Task Force Scope:

- Define what a Layer 1 Specification MUST and SHOULD include.
- Stick to the bare minimum. If a system can do various operations normally at a higher-layer, or if tailoring is required at a higher layer, it may belong there.
